

ASRock AMD 780G

The newest AMD 780G chipset offers an integrated DX 10 graphics core and great multimedia capabilities.

We had a chance to test very interesting boards based on that chipset. **ASRock A780FullDisplayPort** motherboard is really well designed and offers a small DisplayPort card so you can use this new video connector. The performance of the board was really good with Phenom 9600 Black Edition.

We also tried Hybrid CrossFire™ which worked perfectly and gave us some great performance boost with the added HD 3450 card. Also we must say that the **ASRock** board does support newest Phenom 9850 which other 780G boards usually don't. We think that this **ASRock** product is a great base for the advanced home HTPC and offers really great performance and features for your money.
